

1. Create a New Folder

```
mkdir new_folder
```

```
cd new_folder
```

2. Put the Files in the Folder

You can use the touch command to create empty files, or if the files already exist, you can move or copy them into the folder.

```
touch Code.txt Log.txt Output.txt
```

3. Initialize a Git Repository

If you haven't already initialized a Git repository in this folder, do so:

```
git init
```

4. Stage the Code.txt and Output.txt Files

```
git add Code.txt Output.txt
```

5. Commit the Staged Files

```
git commit -m "Added Code.txt and Output.txt"
```

6. Push the Commit to GitHub

Ensure your GitHub repository is set up and linked as a remote. If it's not already linked, add it:

```
git remote add origin https://github.com/Shahid199578/intellipat.git
```

Finally, push the commit to the GitHub repository:

```
git push origin master
```
